DETAILED ACTION

Allowable Subject Matter

Claim(s) 4-6; 13-17; 30-31; 33-43 are allowed.

The following is a statement of reasons for the indication of allowable subject matter: in regard to independent claim 33, while the prior art of record disclose of an audio processor, comprising: a virtualizer configured to process audio information to virtualize at least one speaker such that, from a listener's perspective, sounds appear to come from at least one direction where a physical speaker is not present, the virtualizer comprising: a first feedback crossover path configured to receive, delay, and filter signals output from the virtualizer; and a forward crossover path configured to receive an output of a first filter and , wherein an output of the first feedback path and an output of the forward crossover path are combined to produce at least one output signal from the virtualizer; and a controller configured to cause the virtualizer to virtualize the at least one speaker at any location in a space around the listener.

However, none of the prior art of record disclose of the specific as wherein the forward crossover path configured to filter the received signal with a filter approximating filtering required to provide an optimal inter-time difference to virtualize the at least one speaker and to delay an output of the filter to compensate for a difference between a delay introduced by the filter and the optimal inter-time difference.

Claim(s) 34, 36-37 have been analyzed and allowed for their dependence on allowable claim.

In regard to independent claim 38, while the prior art of record disclose of a device, comprising: an audio source operable to provide audio information; and an audio processor operable to receive the audio information and process the audio information to virtualize at least one speaker so that, from a listener's perspective, sounds appear to come from at least one direction where a physical speaker is not present, the audio processor being configurable to virtualize the at least one speaker at any location in a space around the listener; the audio processor comprises comprising: a virtualizer configured to process audio information to virtualize the at least one speaker, the virtualizer comprising: at least one feedback crossover path configured to receive signals output from the virtualizer, at least one forward crossover path configured to receive, delay, and filter an output of a first filter, wherein an output of the at least one feedback path and an output of the at least one forward crossover path are combined to produce at least one output signal from the virtualizer; and a controller configured to determine a location of the at least one speaker based on a number of parameters including at least a position of at least one actual speaker and configured to cause the virtualizer to virtualize the at least one speaker at the determined location by individually altering a frequency response of one or more crossover path filters and a delay of one or more of crossover path delay lines.

However, none of the prior art of record disclose of the specific as wherein the feedback crossover path configured to filter the received signals with a filter approximating filtering required to provide an optimal inter-time difference to virtualize the at least one speaker and to delay an output of the filter to compensate for a difference between a delay introduced by the filter and the optimal inter-time difference.

Similarly independent claim(s) 40 which cite the similar limitation as in claim(s) 33, 38 have been analyzed and allowed accordingly.

Claim(s) 30-31; 41-43 have been analyzed and allowed for their dependence on allowable claim.

Furthermore, the independent claim(s) 35, 39 have been analyzed and allowed for reason as noted in the last office action.

Claim(s) 4-6; 13-17 have been analyzed and allowed for their dependence on allowable claim(s).
